Abstract (en)

[origin: EP0486790A1] A dishwashing machine, particularly a domestic dishwashing machine, comprising a washing tank, a door to load and close said washing tank, a housing shell (1) obtained on the inner wall of said door, a reservoir-dispenser assembly (3) containing detergent in powder form, consisting of a detergent reservoir (4) and a dispenser (5), the latter detachable from the former. Said reservoir-dispenser assembly is suitable to be removably inserted into said housing shell (1) fixed behind the inner wall of said door. The reservoir of this reservoir-dispenser assembly contains a plurality of doses of detergent which are individually and automatically released during each washing cycle. In this way, the dishwashing machine can operate several times in succession without the need of changing every time the required dose of detergent since said operation is performed by said dispenser which draws the detergent from said reservoir (4) in an amount suited to suffice any type of preselected washing program. <IMAGE>
