Abstract (en)

A layered susceptor material comprising an active microwave absorbing substructure consisting of an inert plastic film substrate layer (10), and an active metal layer (12) deposited on said substrate layer (10), the thickness of said metal layer (12) being selected such that said metal layer has a microwave absorbency of between 10% and 50%. The material comprises furthermore a stock material layer (16) supporting said active microwave substructure and adhered by means of a layer of adhesive (14) to said substructure. The inert plastic film substrate layer (10) is made of a plastic material with a melting point below 200 DEG C and further that the substrate layer material is in an oriented state. The material may comprise a further layer (18) of a material with a melting point above the melting point of said substrate layer (10) adhered by means of an adhesive layer (20) to said active microwave absorbing substructure opposite the surface to which the stock material layer (16) is adhered. <IMAGE>
