Abstract (en)

The present invention relates to an improved ski holding device for mounting a ski (10) on a table such as a work bench (17) to prepare the ski base (10a) and edges (10b,10c). Problems presented by the new trapezoidal and monocoque designs are overcome by using a simulated ski boot (14) to mount the ski. The mounting also provides for pivoting the ski from a position in which the base (10a) is horizontal with the ski inverted, positions in which the base of the ski is vertical and intermediate positions and holding the ski in such orientation. There is additional locking means for holding the base (23) in a horizontal and inverted position. There is also provision for easily disengaging a boot portion of the holding device from a mounting portion (15) of the holding device to reverse the direction which the ski is pointing. <IMAGE>
