Abstract (en)  
[origin: CA2055709A1] In the cooling of UV high-power radiators, the cooling of the inner electrodes (5) which are at high tension potential is critical insofar as it is necessary to use fully demineralized water or oil for this purpose. Since a cooling body (9) must in any event be employed for the external cooling, this cooling body is utilized at the same time as heat exchanger for the internal cooling. (Fig. 1)
