Abstract (en)
[origin: EP0489382A2] This hair dryer comprises a casing (1) of which one region comprises means for fastening onto a wall (P) and which contains a hot-air generator unit (3-4) controlled by a switch (5) and intended to establish a current of air between an air inlet orifice (6) and an air outlet orifice (7), the latter receiving a connector (8) solidly attached to a flexible tube (9) equipped with a drying nozzle (10) which may be brought into either a position of storage or of rest, in which the switch is open, or into a position of use, in which the switch is closed. According to the invention, the connector (8) is mounted movably in rotation on the said air outlet orifice (7) and comprises a means (14) for actuating the switch (5) such that the passage of the nozzle (10) from its storage or rest position to its use position brings the switch into its closed state and vice versa by means of transmission of the movement of the said nozzle to the connector by means of the flexible tube. <IMAGE>
