Abstract (en)
[origin: EP0491124A2] A bearing comprises a bearing yoke with two mutually parallel legs which are provided with aligned holes and also comprises a bearing pin which is held in the holes and passes through a bearing hole in a part rotatably mounted on the said pin. In order to be able to provide the gaps between the rotatable part and the bearing legs with sealing rings in a reliable and safe manner, a retention ring (30) with a lip-type sealing ring (33) vulcanised on or secured on it, the two sealing lips (34, 35) of which, which project beyond the sealing ring on both sides in the axial direction, have a V-shaped profile, is held on the bearing pin (3) on both sides of the rotatable part (4, 8, 9) between the latter and the adjacent leg (4',6;5,7) of the bearing yoke. The lip-type sealing ring (33) is surrounded by a guard and assembly ring (40) which is provided on its inner side with at least one encircling groove (41, 42). For the purpose of assembly, the guard and assembly ring (40) is held eccentrically with the sealing ring (17) comprising the retention ring and the lip-type sealing ring in such a way that the outer edges of the two compressed sealing lips (34, 35) rest with V-shaped profile over a part of their periphery against the inner flanks of the groove (41, 42).
