Abstract (en)
[origin: EP0491634A1] This device secures scaffold boards to carrying structures constituted by prefabricated frames. The boards (8) are equipped at their ends with downwardly turned hooks (7), which are housed in notches (11) which the upper transoms (ledgers) (1) of the lower frames (5) comprise. The lower transoms (ledgers) (2) of the upper frames (6) of width (d) less than that (D) of the upper transoms (ledgers) (1), comprise lugs (13) or other laterally projecting parts, which are located in correspondence with the notches (11) in order to limit the direct upward movement of the hooks (7), whilst permitting a release of the latter by means of a movement comprising a lateral component. Boards (8) can be removed or added without dismantling the carrying structure. <IMAGE>
