Abstract (en)

[origin: US4948607A] A method and apparatus for eliminating fat from a formed ground meat product while maintaining desirable texture and other eating qualities, comprising the steps of placing the product on a support member configured to promote the flow of fat away from the product; bringing the product to a temperature at which a substantial proportion of the fat contained in the meat is liquified; and compressing the product against the support member only after a portion of the fat contained in the meat is liquified, by applying a pressure which repeatedly traverses the product in a plane parallel to the support member for a period and at a pressure level sufficient to exude a substantial portion of the liquified fat from the product. During at least part of the time when pressure is applied, a non-fat liquid is supplied to the top surface of the product.
