Abstract (en)

[origin: EP0493197A1] Process for moulding a liquefiable product, especially soap, according to which a chamber, bounded by at least one wall (4) of elastic material which is resistant to the temperature of the liquefied product, is made inside a rigid mould (1); the internal volume of the chamber (R) is less than that of the mould; the air is expelled from the chamber and it is filled with the liquefied product until it fills all the internal volume of the mould (1). The product contained in the chamber (R) is cooled in the mould and the product is removed from the mould. <IMAGE>
