Abstract (en)

[origin: EP0493329A1] The device forms part of a high speed labelling machine of the type utilizing cold-applied gums, typically as in bottling plant, and serves to support and drive the rotary unit by which single labels are gummed and transferred to the point of application; to advantage, the gumming roller (5) and the centre station (1) which rotates the labels into position are suspended from above, thereby avoiding the damage caused to seals by solidifying and encrusted gum spilled in normal operation, and facilitating the operation of washing the machine (whether automatically or by hand) given that there is no need to dismantle any component part. <IMAGE>
