Abstract (en)

[origin: EP0468121A1] Process for the preparation of a therapeutic composition for internal use, in particular for oral administration, presented as a pharmaceutical dosage form and containing at least one active principle in solid form adsorbed on a substrate, the active product being distributed therein in the state of finely dispersed microparticles and the process being of the type entailing the phases of: - dissolution of the starting active principle in a suitable solvent, - impregnation of the solution thereby formed on a carrier suitable for human consumption, of suitable structure and pharmaceutically compatible with the abovementioned active principle, - evaporation of the solvent from the solution adsorbed within the abovementioned carrier, producing the reconstitution of the active principle by the formation of microcrystals adsorbed on the walls of and within the substrate, - and the process is characterised in that the solvent consists of a binary system containing a main solvent of organic nature and an adjuvant of the type which is solid at room temperature and soluble in the main solvent, the adjuvant possessing, moreover, lubricant properties. s
