Abstract (en)
[origin: WO9104670A1] A method and apparatus are disclosed for use in separating a structurally relatively weak material from a relatively strong material. For example, they may be used for separating meat from a bone. The method includes the steps of displacing a cutter substantially parallel to an interface between the two materials, while monitoring the reaction force applied to the cutter in a direction perpendicular to the travel direction. The travel direction is then adjusted to maintain this reaction force substantially constant.
