Abstract (en)
[origin: EP0495135A1] The connecting stirrup-basket has a plurality of stirrups which are spaced apart next to one another, arranged parallel to one another, bent in a U-shape and have two legs (2, 3) and a transverse web (4). They are connected by at least three longitudinal bars (6, 7, 12). These bars run parallel to one another, spaced apart, and are fixed to the legs (2) of the stirrups and to the transverse webs (4) in two planes at right angles to one another. The other legs (3) in each case remain free from longitudinal bars. At least one of the longitudinal bars (12) is detachably (13) fixed to the legs (2) of the stirrups, while the remaining longitudinal bars (6, 7) are non-detachably connected to the stirrups (1). As a result, the difficulty of pushing on a steel net over a positioned connecting stirrup-basket is eliminated when this is rendered impossible, for example, by a longitudinal bar arranged on a free leg end. <IMAGE>
