Abstract (en)  
[origin: EP0495205A1] A partition (1) for a shower has a door (2) which can be pivoted for opening and is retained in any position with the aid of a support device (3). The support device (3) engages on the one hand with a retaining part (8) on a fixed wall part (5) of the partition (1) or the shower cubicle or on a wall (4) of the building and, on the other hand, via a hinge (9) and a hinge part (10) on the door (2) in such a way that it contacts the door surface with one surface. An attachment element (13), which is connected to said door-side hinge part (10) and its end face and engages on the door (2), is adjustable in its spacing transversely relative to the door surface and relative to the hinge part (10) and thus also relative to the door-side end face of the hinge part (10), that is to say a transverse adjustment of the door transversely to the plane covered by it relative to the hinge (9) is possible so that, when using two hinges located one above the other, the edge of the door and its end face (6) or door-side surface can be adjusted to match a corresponding counter-piece, for example a second door (2) or a fixed wall part (5). Additionally, adjustment in the direction of the plane of the door leaf can also be provided, for example by means of an essentially horizontal guide or rod (11) transversely to the pivot axis (12) of the door hinge (9). <IMAGE>
