Abstract (en)

[origin: EP0495361A1] The invention relates to a mounting for doors equipped with mortise locks (E) and with profiled lock cylinders (26), having a door escutcheon (1) which has in an orifice (17) a plate (19) which covers the end face of the profiled lock cylinder (26) leaving at least one key-insertion orifice free, and in which a chamber for receiving the lock-cylinder core region and its flange projecting radially thereto is provided, said plate (19) being assigned displaceably to the door escutcheon for the purpose of varying the spacing between the handle spindle (11) and the cylinder-core rotary axis of the orifice (17) of said escutcheon, and proposes, for the purpose of achieving a simple change-over capacity, that the orifice (17) in the door escutcheon (1) be larger than the plate (19) by the amount of displaceability, and that the remaining space be filled by a moulding (20). <IMAGE>
