Abstract (en)

[origin: EP0495724A1] In order to vibrate the liquid concrete after it has been poured, and/or during pouring, between two shuttering panels (8), a vibration device (1) is used which comprises a bearing part having two parallel plane surfaces (6) separated from each other by a distance equal to the internal width of the shuttering, and the two shuttering walls are clamped against the said plane surfaces of the bearing part with the aid of threaded rods (20) which bear on the external surface of the two shuttering walls, before setting the bearing part into vibration. <IMAGE>
