Abstract (en)

An extruded glass pane holding metal section for metal fixtures having a substantially L-shaped cross-section formed by two members (14,15) set at an angle to each other, of which one is provided with means (16) of engagement for a face bearing seal (6) for a glass pane (7), and comprising two side-by-side snap-action wings (17,18) adapted to engage in corresponding coupling means provided on the members which form the fixture frame. The spacing (d1) of the side-by-side snap-action wings (17,18) is constant over at least a major portion of their lengthwise extent. This structure is effective to reduce the risk of breakage of the extrusion dies and warping the extruded metal section. <IMAGE>
