Abstract (en)

[origin: EP0496105A1] In a remotely actuated sanitary fitting, the housing is divided a number of times; handle-like projections (6, 7) are detachably joined on both sides to a main housing (1) which contains the channels that carry the water. One of the two handle-like projections (6) holds all the electronic components, especially the transmitter (9), receiver (10) and reception electronics (11), and retains these electronic components at least partially in its cup-shaped housing (52). The other handle-like projection (7) holds all the mechanical components in a similar manner, especially the electrically actuated valve (14, 29), and retains these mechanical components at least partially in its cup-shaped housing (18). <IMAGE>
