Abstract (en)

[origin: EP0496179A1] The method for sewing a stitching pattern on a sewing machine consists in that, to produce a thread section (f) of one or more superposed or adjacent threads, the feeder advances the material being sewn at least twice, with stitch formation discontinued between the advance steps (T). A thread section (f) can thus be produced which has two or more times the stitch length T of the sewing machine. The stitching patterns, like cross-stitching, produced in this manner can be made considerably larger than was hitherto possible. So that the threads of the thread sections (f) between the end points have a greater elasticity and hence the danger of gathering the material being sewn is avoided, in each case preferably at least two stitch formations are performed at the end points. The quantity of thread contained in the thread section (f) is thereby increased. <IMAGE>
