Abstract (en)

[origin: EP0497161A2] In order to design a locking comb (9) for an electrical connector (1) which is easy to handle both before and during installation in the electrical connector (1), at least one web (16) is integrally formed between at least two adjacent tines (13). In consequence, the comb (9) is sufficiently stable against incorrect engagement and is dimensionally stable for insertion into the electrical connector (1). <IMAGE>
