Abstract (en)
A device for filtering a gaseous medium flowing in a pipe (B), which device consists of a first annular member (1) extending along the inner wall of the pipe (B) and a second annular member (2) located at a distance, wherein a filter (3) is arranged extending between both members (1,2) and preferably supported by a spiral wire and which is formed from a strip of filter material into a bag-like body (3) tapering in the direction of the second annular member (2), this such that the filter material is easy to replace. <IMAGE>
