Abstract (en)

[origin: EP0498030A2] The invention relates to a method for correctly positioned delivery of objects which are connected to a conveyor belt (TB) via a web (STG). In this case, the web (STG) is provided on at least one side with a notch (K) and an indentation (S), and is subsequently bent about an axis (a) until the desired delivery position is reached. The objects are centred hereon, are fixed and are finally separated from the web (STG) at the notch (K). The separated objects can thus be gripped by an assembly tool and inserted into a supporting body without further manipulation being required. <IMAGE>
