Abstract (en)  
[origin: EP0499168A1] The holding plate (13) and the closure plate (14) are constructed as an integral moulding which is produced from a punched blank by folding. Furthermore, transversely running slats (16) are assigned to the closure plate (14) for the purpose of displacement in their longitudinal direction, which slats are formed by incisions (17) extending over a partial thickness of the moulding. The slats (16) extend at least over the transition region from the holding plate (13) to the closure plate (14). The incisions (17) run parallel to one another with relatively small spacing.
