Abstract (en)
The lamp comprises a lamp cap (10) with a metal shell (30) in which an insulator body (50), with a circumferential outer surface (51) between a first, and a second end face (52, 53 respectively) is locked. The insulator body (50) has recesses (54a, 54c) in its second end face (53) that extend from a boundary surface (55a, 55c), which is transverse to the second end face (53), up to the circumferential outer surface (51). The metal shell (30) has, at a cross-section (X-X), first tongues (31a, 31c) which are present in the recesses (54a, 54c). The first tongues (31a, 31c) point obliquely away from the first end face (52) and press with their free ends (32a, 32c) against the boundary surfaces (55a, 55c) of the recesses (54a, 54c). <IMAGE>
