Abstract (en)

[origin: WO9107029A1] Proposed is a radio receiver, in particular for vehicles, which is fitted with a decoder for decoding digitally encoded traffic information received, in particular, over the so-called RDS system. Also included is a transmitter store in which all receivable radio transmitters are stored at regular intervals. This transmitter table is compared with a table stored in a store in the receiver and in which the radio transmitters are associated with particular regions. If substantial correspondence is found between the radio transmitters received and those stored, the appropriate region is selected and only that traffic information which concerns the region selected is output.
