Abstract (en)

[origin: EP0500180A1] Routing system for, for example, items of mail. At the beginning of the routing system (RS), the address (a) is converted into an electronic code signal (c1). Said code signal can be changed and/or supplemented from the outside by means of parameter signals (p), resulting in a converted code signal (c2). The system achieves the result that the delivery of items of mail can be influenced 'on line', i.e. the address, ('follow me' mail), the time or the form or manner of delivery. On-line information (i) can also be obtained on items of mail (for example their status).
