Abstract (en)

[origin: EP0500476A1] This model football player is of the type consisting of two elements which can be assembled to each other, at least one of which can be engaged on the support rod and at least one of which supports a stud which can be engaged in a radial hole provided, for it to pass through, in the rod segment intended to receive this model football player (3). On the one hand, one (3a) of the elements forms virtually the entire body thereof and has a transverse hole (4) passing right through it, from one side to the other, and with the same transverse section as the rod (2) and, on the other hand, the second element (3b), which can be assembled to the first element (3a) by means of complementarity of shape, forms one end part of the body of the model football player, such as the head or the feet, and carries a cylindrical spindle (7) which acts as the stud (7) and which, to this end, is suitable for axial engagement in the first element (3a), its length being sufficient to enable it to pass right through the support rod (2), in the manner of a pin, via the chosen radial hole (6). <IMAGE>
