Abstract (en)
[origin: EP0501188A1] The invention relates to a key-operated switch having a cylinder lock (11) which has a fin (16) which can pivot about the cylinder axis (15), especially a profiled half-cylinder lock, and having a switch (18) which has a switch shaft (19) and can be operated in a rotating manner, especially a cam switch, for switching various selection programmes, the cylinder axis (15) of the cylinder lock (11) which is arranged adjacent to or above the switch (18) running parallel to the switch shaft (19) and it being possible to transmit the pivoting movement of the fin via gearing (20) to the switch shaft (19). In this case, the operating end (21) of the switch shaft (19) is arranged on the side facing away from the operating side of the cylinder lock (11), and the fin (16) of the cylinder lock (11) can be brought into rotationally-driven connection, in a positively-locking manner, via a driver finger (17) with an input shaft (22) of the gearing (20), which is arranged on the side of the cylinder lock facing away from the operating side of said cylinder lock (11). <IMAGE>
