Abstract (en)

[origin: EP0502303A1] For the pretreatment of objects with fluorine, a stock vessel (1) is provided in which the gas used for the treatment is prepared and held ready under a reduced pressure of about 0.2 bar. The objects to be treated are introduced into a reaction chamber (2, 3) which is likewise evacuated after closing. The gas is then pumped from the stock vessel (1) into the particular reaction chamber (2, 3). After the pretreatment with fluorine, the gas is passed back into the stock vessel (1) and from there, after renewed adjustment of the fluorine concentration by adding fluorine, again fed to a reaction chamber (2 or 3). <IMAGE>
