Abstract (en)

[origin: EP0502800A1] The invention relates to a roller shutter for a door, window or the like, comprising a box (13) surmounting a renewed frame (2) which is capable of covering, from the inside, a preexisting frame (3). With a view to guaranteeing better impermeability of the assembly and making a location which is sufficiently capable of receiving the control mechanism (20) for rolling up and unrolling the shutter, said box (13) has, in the region of its front wall (14) and on a level with its lateral edges, a set-back (32) which defines a first box part (33) of a width which is smaller than the distance between the uprights of the preexisting frame and a second box part (37), the width of which is adjusted to the overall width, on the internal side, of the renewed frame (2), this second box part (37) comprising, in the region of its ends, a housing (42) situated beyond the support cheeks (21) and delimited by independent end plates (23) which laterally enclose said box (13) in order to receive the control mechanism (20). <IMAGE>
