Abstract (en)
[origin: WO9206247A1] A parking prevention means comprises a housing (1) containing a power supply, a controller signal receiver unit, said signals controlling a motor coupled to a shaft (8) bearing a movable part (2) which the motor moves from a substantially horizontal position to a substantially vertical position and vice-versa. The movable part comprises one or more legs (3) which are substantially non deformable and also includes means enabling the shaft to impart itsrotational movement to the movable part, whereas rotation of the movable part caused by an external force does not result in associated rotation of the shaft.
