Abstract (en)
[origin: EP0503149A1] The building hoist has a basic frame (1) which can be supported on the ground, a multipart vertical guide mast (2) which can be connected to the frame, and a lifting carriage (3) which is vertically movable on the mast and is provided with hanging means on its front side which faces away from the guide mast. Two conveying baskets (4, 4') can be hung alternately on the same lifting carriage (3). For this purpose, on the basic frame (1) on both sides of the guide mast (2) and at a distance from the latter, a horizontal support arm (8, 8') for each conveying basket is mounted pivotably by approximately 90 DEG about a vertical pivot axis (9, 9') in such a manner that its free end (8a, 8'a) is situated in a first pivoting position in front of the lifting carriage (3) and in the second pivoting position at the side of the same. Fastened to each support arm (8, 8') close to its pivot axis (9, 9') is a vertical holding support (10, 10') which, in the first pivoting position, is arranged at the side of the lifting carriage. Arranged on the longitudinal side of each conveying basket (4, 4') facing towards the lifting carriage (3) is a holding bracket (11, 11') which interacts with the associated holding support (10, 10') and, on the underside of each conveying basket, a centring piece (12, 12') which can be saddled onto the free end (8a, 8'a) of the associated support arm. <IMAGE>
