Abstract (en)

[origin: EP0503370A1] A resonant circuit coil is proposed which makes large-scale miniaturisation possible, can be produced without problems and offers the preconditions for simple installation, for example on printed-circuit boards. In detail, side walls (16, 17) having pegs (20, 21), and a winding mandrel (18) located between the side walls (16, 17), are constructed on the coil former (15). The coil core (27) is formed by a strip of amorphous ferromagnetic metal which is mounted in the base (28) of a groove (26) which is constructed on the coil former (15). Contact pins (24, 25) are used together with the pegs (20, 21) for mounting the resonant circuit coil (7) on a printed-circuit board and for making contact between the winding (31) and the conductor tracks of this printed-circuit board.
