Abstract (en)

The spring attachment is made up of a single part which has a first (7) and a second end (6), which are connected by one or more arched zones (9,10,13) set on more or less the same plane. The said first and second ends are removable and positionable within countershaped housings which can be machined on a ground anchor and positioned behind the base of the track. The arched zones which connect the said first and second ends prefer one or more sections which interact with the bottom of the track and the ground anchoring piece. A construction particularly applicable for the building of railway lines made for carrying especially high speed trains. <IMAGE>
