Abstract (en)

Sterilized and disposable stick for stimulating the defecation reflex in children by contact with and distension of the anal duct and which, being made of a suitable material such as rubber and/or transparent plastic strong enough to prevent the instrument from breaking during use, is made up of a stick-shaped body divided into three clearly differentiated parts, one of which consists of a point (1) of contact with and distension of the anal duct, another consisting of a safety disk (2) that acts as a buffer against excessive penetration, while the third consists of a handle (3) or grip. The instrument has been designed in such a way that the three parts form a -- single body without interruptions and are situated in a correlative way.
