Abstract (en)

[origin: EP0504555A2] The cooking unit has a control device with a moisture sensor which determines the respectively current degree of moisture in the carried-off vapours of the product being cooked and uses it for controlling the heating unit. According to the invention, there is arranged in the outlet duct for the vapours a condensate collector made of heat-conducting material, to which heat energy is supplied by condensation of the vapour. This heat energy is carried off to the outside by a regulating device, the energy value, which is necessary for carrying off this heat energy, being used as a control value for the control device. <IMAGE>
