Abstract (en)
A television receiver/decoder includes means (8) to detect what channels are capable of being received by that receiver/decoder. A first memory (12) stores data relating to all possible channels. A second memory (14) is used to store data relating to the channels that receiver/decoder is arranged to receive. The second memory is selectively loaded with data from the first memory in dependence on the channels the detecting means determines the receiver/decoder can receive. One of a plurality of Low Noise Blocks (LNB's) in an antenna can be selected by a control signal which causes power to be selectively applied to an LNB. One of a plurality of oscillators (60) in an LNB of an antenna can be selected providing a frequency generator (54) coupled to a lead for the antenna signal and operable to produce at least one frequency signal in response to a control signal. The antenna includes a switch (58) which switches between oscillators in dependence on the received frequency signal. <IMAGE>
