Abstract (en)
[origin: DE4029120A1] An adjustment mechanism (3) is used for the angle of inclination between the foot part (10) of the fixture and the shaft part (11), together with setting the angle range in which the shaft part is pivotable in relation to the foot part. In the rear section of the shaft part (11) is a cross-sectionally round channel (40) in the shaft longitudinal direction. - In the channel are two spaced nut recesses (41, 44), the dia. of which is greater than that of the channel, and which are open to the rear side of the shaft part (11). Stops (42, 43, 45, 46) for the transition between the channel and the nut recess are formed at right-angles to the channel axis (47).
