Abstract (en)
The invention relates to a bending-cutting machine for producing frames of reinforcement made up of reinforcing bars, of the type in which a finger provided with a roller pivots through an adjustable angle around a circular mandrel in order to bend the reinforcing bar around the latter. It furthermore comprises a cutting device, one of the blades (7) of which is located in a recess (5) of the circular mandrel (1), the said recess (5) being located near the point (6) where the reinforcing bar (4) comes into contact with the mandrel (1) at the start of the bending process. <IMAGE>
