Abstract (en)

[origin: WO9109368A1] A method and apparatus for rapid search and co-display of graphics and tabular data for both local (10) and distributed computer systems (20). The method rapidly selects and displays (12) related graphical and text information via a Graphical User Interface (16) (GUI) from both a Graphical Relational Database (GRDB) and large tabular database. An operator enters a query where previously encoded and stored graphics elements are selected, via a control program, from a local mass storage device (22) and displayed (12) with related text information on a local display (12). This method provides intelligent selection and display (12) of graphics data based on an analysis by the system (10) as to what graphics elements or images are required to satisfy the operator query, and how these elements are to be displayed (12) in conjunction with related tabular (text) data.
