Abstract (en)

[origin: EP0507098A1] A conveying device of a transfer press for transporting large-sized pieces is proposed in which pieces arranged at an angle in particular in the tool space are to be changed in their position during the feeding or discharge movement. For this purpose, the cross beams (25 to 28) are constructed so as to be rotatable with regard to their longitudinal axis, the rotary movement being effected by a cam mechanism via a pivoted-lever system driven together. <IMAGE>
