Abstract (en)
A laundry detergent composition, comprising a tenside component, a builder component having a builder A including one or more ion-exchangers, a builder B including one or more ion-transferring agents, a builder C including one or more precipitation inhibitors, a builder D including one or more soil-suspending agents as well as optionally further builders and optionally one or more adjuvants and additives. The laundry detergent composition causes less incrustations and lime depositions on the heating elements of washing machines without having to increase the dosage in case of hard supply water.
