Abstract (en)

[origin: WO9109689A1] A device for cleaning mechanical appliances, small parts and/or electronic switch units using cleaning liquids comprises a cleaning chamber, which is ventilated by means of a fan with a baffle plate arranged in front of its intake opening and which has a closable charging opening, and a discharge below the cleaning chamber which collects the cleaning liquid to be regenerated. The cleaning chamber is mounted above a square, closed substructure. The delivery connection piece of the fan is connected by a pipeline to the base region of the substructure. A ventilation pipeline leading into the cleaning chamber and an evacuation pipeline open into the upper region of the substructure. A rotary table in the cleaning chamber holds the objects to be cleaned. The cleaning chamber (3) has at least one rising pipe (55) which is supplied with cleaning liquid by a pump (58) and which has spray nozzles (56) directed toward the rotary table (12).
