Abstract (en)

[origin: EP0509385A1] Method of producing wall-shaped or floor-shaped concrete or cement bodies in the ground, in which grout columns (12), parallel to one another and at least tangent to one another, are constructed one after the other by the nozzle jet method from an injection stem (9) driven into the ground and form the concrete or cement body after the hardening, and in which sheet-piling or reinforcing elements (6) are in each case sunk at the same time as the injection stem individually or in groups inside one grout column (12) each, which sheet-piling or reinforcing elements (6) remain in the grout column when the injection stem is withdrawn. <IMAGE>
