Abstract (en)

The invention provides apparatus comprising a housing (10) for retaining in position a replaceable container (15) having a reciprocable button (16) for discharging material from the container through an outlet nozzle (18) in the button. Means (19) are provided for at least depressing the discharge button (16) actuated by a battery operated electric motor. The container and battery or batteries for operating the electric motor are combined as a unit. The invention also provides a container (15) for the apparatus comprising a receptacle (42) for the material to be discharged, and an outlet (43) in the receptacle for receiving a reciprocable button (16) for discharging material from the receptacle through an outlet nozzle (18) in the button. A separate compartment (33) in the container is provided for receiving the battery or batteries (30) required, the compartment having means (36, 37) allowing the battery or batteries, in use, to engage electrical contacts (31, 32) within the apparatus intended to receive the container (15). <IMAGE>
