Abstract (en)

[origin: EP0511090A1] The present invention relates to a device for achieving a visible surface (2), with no discontinuity, of at least one partition element (1), comprising at least one housing (3) for an element (4) to be flush-mounted, characterised in that it consists of a diaphragm (12) stuck to the visible surface (2) of the partition (1) and covering the element (4) beyond the jointing plane formed between the lateral edges of the said element (4) and of the housing (3), in order to form a flat joint cover which is able to render the flush-mounting leaktight, whilst ensuring continuity of the visible surface (2) of the partition, in a substantially identical plane, by levelling the diaphragm (12) with the said surface (2) and to render the latter leaktight and smooth. <IMAGE>
