Abstract (en)

[origin: EP0511425A1] A spreading station, in particular for spreading the top layers of particle boards, is proposed in which the material to be spread, which is conveyed from a storage bin (1), is divided up into several fractions of different particle size before being deposited onto the forming belt (7). For effective separation of even the finest particles, the material to be spread, coming from the storage bin (1), is first deposited onto an intermediate belt (6), the belt speed of which is many times greater than the belt speed of the forming belt (7), and is then thrown down onto the forming belt (7). <IMAGE>
