Abstract (en)

Method for concrete floor shuttering, using a modular supporting system comprising: - Props (1) with projecting head (2); - primary beams (3) intended to be attached to the heads (2) of the props (1); - secondary beams (4) intended to be attached to the sides of the primary beams (3), these primary beams (3) and these secondary beams (4) being shaped in such a way that when the first ones (3) are attached to the heads (2) of the props (1) and the second ones (4) are attached to the side of the primary beams, the upper surfaces (S) of the said secondary beams (4) lie in a plane (P-P) located above and at a distance from the plane (P'-P') in which the upper surfaces (S') of the said primary beams (3) are placed, this method being characterised in that the shuttering skin (33) is rested on the upper faces (S) of the said secondary beams (4), so that a space (d) is created, below the said shuttering skin (33), between the planes (P-P P'P') in which the upper faces (S; S') of the secondary beams (4) and of the primary beams (3) respectively are arranged. <IMAGE>
