Abstract (en)

[origin: WO9111818A1] An electromagnetic relay has a coil body (1), which supports a magnet system, and a base. The coil connection elements (3, 4) which connect the coil body to the base are fastened to the coil flange (11, 12) by horizontal fastening branches (33, 34, 35, 43, 44) in matching insert channels (13, 14, 15, 16, 17) in the coil flange (11, 12). Wind-on pieces (36, 46) which carry the ends of the coil winding directly are formed on the coil connection elements (3, 4). The relay can therefore be manufactured simply and automatically from a small number of components.
