Abstract (en)

[origin: WO9111556A1] A device for attaching a rail to a support (1) comprising a spring blade (5) pivotably mounted on the support by means of a clamping device (6) which passes through the blade (5) via an opening (53) and can move between a transport position in which the rail can also be laid and a working position in which it is supported by the rail, as well as an insulating insert (3) placed between the support (1) and the blade (5). The device is characterized in that it comprises devices for clamping and locking said blade so that it can be pre-mounted on the support without hindering the subsequent laying of the rail and so that it can be pivoted and held against the rail once the rail is in place.
